UltraEZ Desensitizing Gel Custom Tray Patient Instructions

See Instructions for Use for complete instructions, warnings, and precautions.

Step 1

Express UltraEZ gel into the custom tray. A complete arch should use most of the contents of one syringe. If sensitivity is localized, place gel in affected area(s) and a small amount in the molar region to hold the tray in place.

Step 2

Make sure teeth are brushed before placing the loaded tray on the arch.

Step 3

Gently press the tray edges against the arch labially and palatally.

Step 4

Remove excess gel with a soft toothbrush or clean finger.

Step 5

With the tray in place, treatment time begins now.

Step 6

At the end of treatment, brush the teeth, being careful not to swallow the UltraEZ gel, and use a soft toothbrush and cold water to clean the tray.
